Chapter 5 Ecological footprints

1 IPCC, 1992. The major greenhouse gases are carbon dioxide, methane and nitrous oxide, and a range of ‘man-made’ industrial fluorocarbon chemicals: CFCs, HCFCs, HFCs, and PFCs. Of these, carbon dioxide contributes most seriously to global warming.

6 See, for example, Ericksen N J et al Socio-economic implications of climate change for Bangladesh Bangladesh Unnayan Parishad, Dhaka, 1993.

13 Bangladeshi rice farmer, *Panoscope* April 1994, quoted by Fox N.

17 Rees W ‘Ecological footprints and appropriated carrying capacity’ in *Environment and Urbanisation* 4, October 1992. Sinks refer to natural resources which absorb gases: in this case, forests absorbing CO2, for example.

18 Van Brakel M and Buitenkamp M *Action Plan for a Sustainable Netherlands* Milieudefensie, 1992. This section owes much to the work of Nick Robins at IIED, who also draws attention to some of the dangers of misuse of these concepts, for example, to justify authoritarian population policies.

The International Oxfam Group

The international Oxfams are autonomous, non-profit development agencies. They work to overcome poverty and social injustice through the empowerment of partner organisations and communities to achieve sustainable development and livelihoods, and to strengthen civil society in any part of the world, irrespective of nationality, race, political system, religion, or colour. The members of the group are Oxfam America, Oxfam Belgium, Oxfam Canada, Community Aid Abroad (in Australia), Oxfam New Zealand, Oxfam Hong Kong, NOVIB (in the Netherlands), Oxfam Quebec, and Oxfam United Kingdom and Ireland. The name Oxfam comes from the OXford Committee for FAMine relief, founded in Oxford, England in 1942. The Oxfam International Advocacy Office in Washington opened in January 1995.
